- Effect positive physiological changes

BENEFITS OF MUSIC THERAPY FOR CHILDREN (CONT.)

Sharing music instruments

1. Sharing

2. Cooperating

Echo, Match the sound

3. Listening

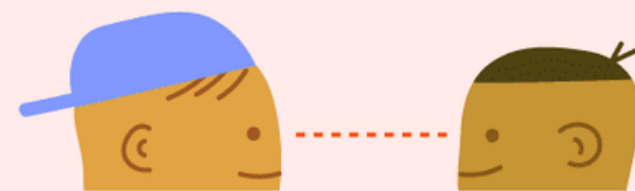

4. Following directions
start/stop

5. Respecting personal space

playing music together

mirror dance

6. Making eye contact

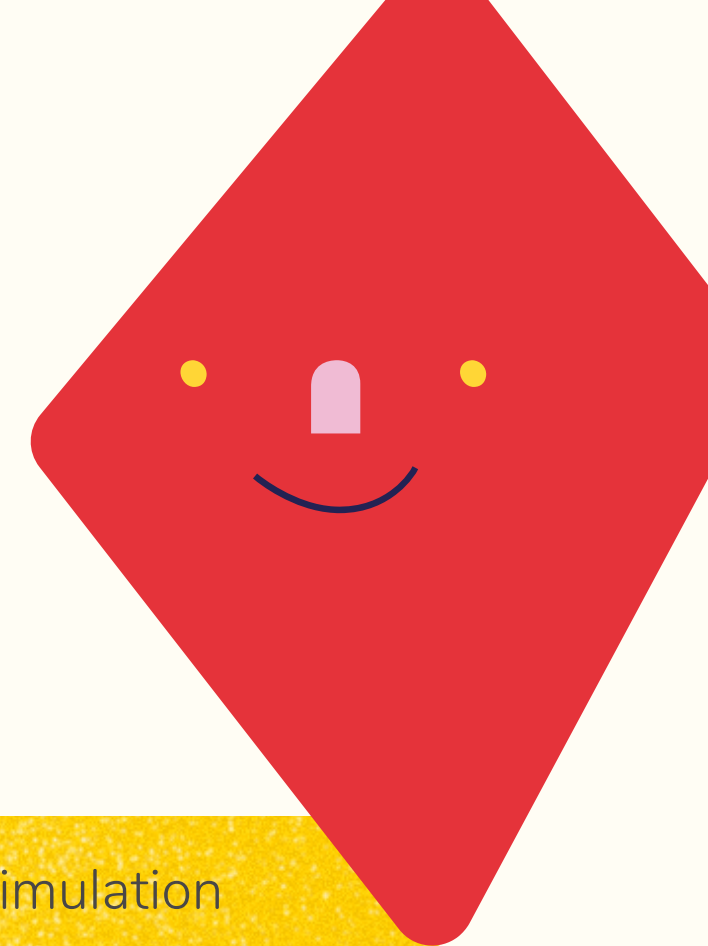

7. Using manners

Greeting songs,
Passing instruments

MUSIC THERAPY SESSION

Although every music therapy sessions is different, here are some examples of common experiences and techniques by age group.

INFANTS

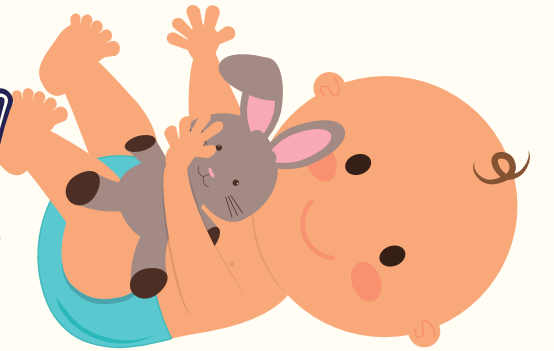

Music therapy for infants is typically aimed at relaxation or developmental stimulation goals. Music therapy may reduce stress in infants, increasing oxygen saturation and lowering heart and breathing rate. When interacting with an infant, a music therapist might:

- Sing or hum softly to baby
- Play a reverie harp or guitar
- Use a variety of interactive percussion instruments and songbooks to encourage reaching, grasping, visual attention and interaction
- Adapt music to be appropriate for infants who are able to tolerate only minimal levels of stimulation
- Encourage family involvement through singing along, rocking their baby
- Teach families how to use music to encourage growth and development

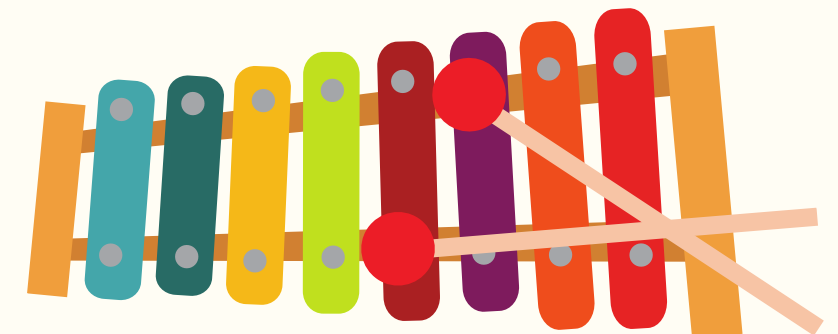

MUSIC THERAPY SESSION

Although every music therapy sessions is different, here are some examples of common experiences and techniques by age group.

TODDLERS / PRESCHOOL AGES

- Music therapy encourages creative expression of emotions
- opportunities for choices and control
- ways to cope with their hospital experience
- provide distraction during uncomfortable procedures
- provide opportunities to play and choose instruments such as drums, shakers, xylophones and harmonicas
- Playing and listening to familiar songs can create a feeling of security for toddlers and preschoolers

MUSIC THERAPY SESSION

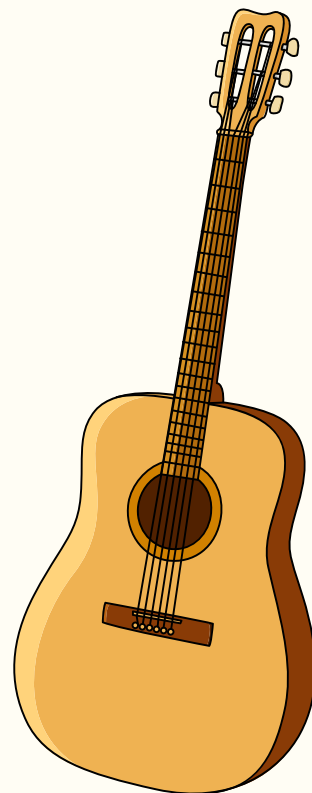

Although every music therapy sessions is different, here are some examples of common experiences and techniques by age group.

SCHOOL-AGE

Music therapy for school-age kids can be similar to interventions provided for younger children, but older children may be able to engage in more complex interventions, such as

- songwriting
- free improvisation
- guided relaxation techniques

- A school-aged child may be able to engage in projects which take more than one session to complete, such as writing and recording an original song or learning a simple song on the guitar or xylophone
- These interventions can promote mastery and self-esteem as well as encourage involvement in their society.

MUSIC THERAPY SESSION

Although every music therapy sessions is different, here are some examples of common experiences and techniques by age group.

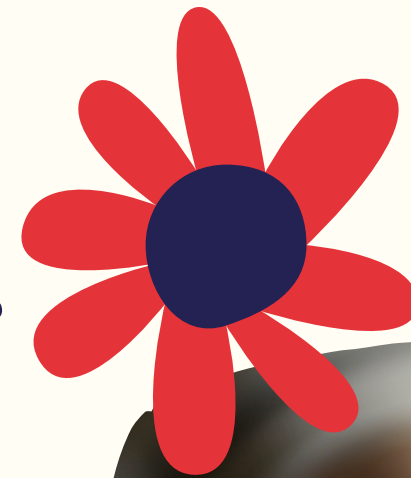

ADOLESCENTS

Music therapy for adolescents can be helpful for actively processing feelings and emotions associated with illness, developing techniques to cope with anxiety and pain, and providing normative musical experiences. Adolescents may engage in:

- Songwriting
- Creation of playlists to promote mood change
- Lyric analysis to promote emotional processing, relaxation or movement goals
- Guided relaxation and learn techniques to be used outside of the music therapy session

A CASE STUDY OF JONAH

For one young man, music therapy changed his life.

Music Therapy expert Kat Fulton describes the obstacles and achievements that Jonah, completely blind child- born without eyes. He was a preemie born at 21 weeks and adopted by his family.

Before Jonah started music therapy he was unable to read braille and could not cope with difficult tasks.

Through working with his music therapist and using his natural affinity for music, he has started learning how to read, vocalizing two to three words at a time – dramatically increasing his communication skills.

Beyond his improvement in language, and with the help of music, Jonah is able to stay calm in situations that would have previously frustrated him, such as learning to tie his shoes. Where other strategies have failed to yield progress, music therapy has succeeded in helping this child live a more fulfilling life.

CONCLUSION

Music can be used throughout the child's day and in many ways.

Music Therapy can be the therapy that supports and enhances the goals of all other therapies and treatments.

The strategies and therapeutic benefits of music that are developed and facilitated can thereby enhance the whole child, as well as those who share in his or her world
